graph and model transformation pdf
In computing, a graph database (GDB) is a database that uses graph structures for semantic queries with nodes, edges and properties to represent and store data. A key concept of the system is the graph (or edge or relationship), which directly relates data items in the store.The relationships allow data in the store to be linked together directly, and in many cases retrieved with one operation.

Graph database - Wikipedia
In mathematics, graph theory is the study of graphs, which are mathematical structures used to model pairwise relations between objects.A graph in this context is made up of vertices, nodes, or points which are connected by edges, arcs, or lines.A graph may be undirected, meaning that there is no distinction between the two vertices associated with each edge, or its edges may be directed from ...

Lecture 2 Linear Regression: A Model for the Mean
Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.
