ABSTRACT. Total dissolved solids (TDS, in mg/L) can be estimated from measurements of electrical conductivity at 25°C (EC, in $\mu\text{S}/\text{cm}$) by applying a conversion factor f . This factor is commonly reported to range from 0.54 to 1.1. For 45 South African mine-water samples, factors between 0.25 and 1.34, with a median of 0.85, were determined.

Reduction and oxidation measurements create important data for analysis of wet soils. These measurements are actually recordings of voltage (EH) over time between a reference electrode and a sensor electrode inserted into a soil. The sensor electrodes are usually made of platinum wire (Pt electrode).
